KIRLOSKAR CHILLERS PRIVATE LIMITED

A Kirloskar Group Company

ENGINEERING SPECIFICATION

Document Name: Chiller Design and Test Pressures

Document No.: ESP/07-08/107

Revision No.: R10

Revision Date: 22nd January 2021

Prepared By: SSM

Checked By: SNM

Approved By: SSN

Chiller	Model	Refrigerant	Heat Exchanger Pressures										Unit Pressures	
				Maximum Operating (Refrigerant side)	Design (Refrigerant side)	Maximum Operating (Water side)	Design (Water side)	Tube Side Test ⁽⁴⁾ Pressure		Shell Side ^(4 & 5) Test Pressure		Safety valve	Unit test Pressure ⁽¹⁾ without relief valve (Refrigerant side)	
				Bar	Bar	Bar	Bar	kgf/cm ²	kgf/cm ²	kgf/cm ²	kgf/cm ²	Bar		
								Hydrostatic	Pneumatic	Hydrostatic	Pneumatic

Notes:

- Unit test pressure with Relief valve = $0.9 \times \text{Design Pressure (Safety valve set pressure)}$. For LP side consider evaporator safety valve set pressure and for HP side consider condenser safety valve set pressure.
- For Oil separator pressures, Refer respective Condenser pressures and safety valve rating.
- Design temperature for Standard & CE (except CE Centrifugal) Evaporator & Condenser is 65 °C & 100 °C Respectively. Design temperature for CE Marked Centrifugal Evaporator & Condenser is 65 °C & 65 °C Respectively.
- All the pressures mentioned above are applicable for standard chillers. Don't refer these in case of Heat Pumps.
- On Refrigerent side, hydrostatic test shall not be performed. According to ASME Sec VIII Div I, UG-100, for vessels where water traces are harmful, hydrotest can be avoided. Only pneumatic test is sufficient.
